

Working With Fondant Icing For Beginners

Working With Fondant Icing For Beginners

Downloaded from remodelicious.com by Laylah & Howe

GETTING STARTED WITH WORKING WITH FONDANT ICING FOR BEGINNERS

Stepping into the world of cake decorating can feel both exciting and a little daunting. Among the many techniques you will encounter, few are as visually rewarding as mastering the art of rolling and draping fondant. For those who are just starting their baking journey, the idea of covering a cake with a smooth, flawless layer of fondant might seem reserved for professional bakers. The truth, however, is that working with fondant icing for beginners is entirely achievable with the right guidance, a bit of patience, and a few essential tricks of the trade. This guide is designed to walk you through every step, demystifying the process and giving you the confidence to create stunning cakes right from your own kitchen.

Fondant, sometimes referred to as sugar paste, offers a clean, elegant finish that buttercream simply cannot match. It provides a perfect canvas for intricate designs, sculpting, and painting. While it does require a slightly different skill set than spreading frosting, the learning curve is not as steep as many beginners fear. By understanding the environment it needs, the tools that make it manageable, and the basic techniques for covering a cake, you will be well on your way to producing professional-looking results. Let us begin by looking at the different types of fondant and how to choose the right one for your first project.

Understanding the Different Types of Fondant

Before you start kneading, it is helpful to know what you are working with. Not all fondant is created equal, and choosing the right type can significantly impact your success as a beginner.

- **Rolled Fondant:** This is the most common type used for covering cakes. It is a pliable dough made primarily from sugar, water, and gelatin or glucose. You roll it out like pastry and drape it over your cake. Most store-bought brands are reliable and consistent for beginners.
- **Poured Fondant:** This is a thin, liquid icing that is poured over cakes or pastries. It sets to a smooth, matte finish. While useful for petit fours or donuts, it is not what you will typically use for covering a standard layered cake.
- **Marshmallow Fondant (MMF):** A very popular choice for home bakers. It is made by combining melted marshmallows with powdered sugar. It is significantly easier to make at home, tastes better than many commercial brands, and is incredibly forgiving for beginners. It is also less likely to crack or tear.
- **Gum Paste:** This is not the same as fondant. It contains a gum additive (like tylose powder) that makes it dry very hard and hold its shape. It is excellent for making flowers and intricate decorations, but it is not suitable for covering an entire cake.

For a beginner, starting with a high-quality store-bought rolled fondant or a homemade marshmallow fondant is usually the best route. These options offer the right balance of elasticity and strength needed to learn the basic covering techniques.

Essential Tools for Your Fondant Journey

While you can technically roll fondant with a standard rolling pin, having the right tools makes a world of difference. You do not need to buy everything at once, but a few key items will make working with fondant icing for beginners much easier and more enjoyable.

- **A Non-Stick Rolling Pin:** A large, smooth rolling pin is essential. Look for one that is specifically designed for fondant, as it will be longer than a standard pastry pin, allowing you to roll out a large sheet evenly.
- **A Large, Smooth Work Surface:** You need a clean, dry, and perfectly smooth area to roll out your fondant. A marble slab, a smooth wooden board, or even a clean countertop works well.
- **Cornstarch or Powdered Sugar:** This is your best friend. You will use it to dust your work surface and your rolling pin to prevent the fondant from sticking. Keep a small bowl of it nearby.
- **Fondant Smoother:** This is a flat, paddle-like tool used to polish the surface of the fondant once it is on the cake. It helps remove air bubbles and fingerprints, giving you that sharp, clean edge.
- **A Sharp Knife or Pizza Cutter:** For trimming the excess fondant from the base of the cake. A pizza cutter provides a very clean, consistent cut.
- **Bench Scraper:** Useful for lifting the rolled fondant off the surface without tearing it.

Beyond these basics, you might also consider a turntable for easier access to all sides of your cake and a set of modeling tools for adding details. For now, focus on gathering the core items listed above.

Preparing Your Cake: The Foundation of Success

One of the most common mistakes beginners make is trying to apply fondant to a poorly prepared cake. The fondant will only look as good as what is underneath it. A bumpy, uneven buttercream layer will translate directly through the fondant.

First, your cake layers must be level. Use a serrated knife or a cake leveler to cut off the domed tops so that each layer is flat. Next, you need to create a "crumb coat." This is a thin layer of buttercream that seals in the crumbs and creates a smooth surface. Once the crumb coat is applied, refrigerate the cake for about 15-20 minutes to let it set.

After the crumb coat is firm, apply a thicker, final layer of buttercream. This is called the "dirty ice" or "masking" stage. You want to fill any gaps between layers and create a perfectly smooth, even coating. Use a bench scraper to get the sides as straight and flat as possible. The smoother this layer is, the smoother your final fondant will look. Finally, place the cake in the refrigerator for at least 30 minutes, or until the buttercream is firm to the touch. A cold, firm cake is much easier to

work with.

Kneading and Coloring Your Fondant

Before you roll, you must knead. Fondant straight out of the package is often stiff and dense. Kneading warms it up, making it pliable and soft. Dust your hands lightly with shortening (not powdered sugar, as it can dry the fondant) and begin to work the fondant. Fold it, press it, and turn it. It is ready when it feels like soft, smooth clay. If it cracks at the edges when you fold it, it needs more kneading.

If you plan to color your fondant, now is the time to do it. Use gel or paste food coloring, not liquid food coloring, as liquid will make the fondant sticky and unworkable. Add a small amount of color to the center of your fondant ball and knead it through. The color will deepen as you knead. Wrap the colored fondant tightly in plastic wrap and let it rest for about 10-15 minutes. This resting period relaxes the gluten (or, more accurately, the sugars) and makes it much less likely to shrink or tear when you roll it out.

The Rolling and Draping Technique

This is the moment you have been preparing for. The key to success is rolling the fondant to a consistent thickness. Aim for about 1/8 inch (3-4 mm) thick. It should be thin enough to work with but thick enough that it does not tear easily.

1. Lightly dust your work surface and rolling pin with a small amount of cornstarch or powdered sugar.
2. Flatten your fondant ball into a thick disc, then begin rolling from the center outward. Lift and rotate the fondant frequently to ensure it is not sticking to the surface. Add more dusting powder as needed, but use it sparingly. Excess powder can dry out the fondant.
3. Roll until the fondant is large enough to cover the top and sides of your cake with some overhang. A good rule of thumb is to measure the diameter of the cake top, plus the height of the sides twice, plus an extra 2-3 inches for safety.
4. Loosen the fondant from the work surface using your bench scraper. Gently roll the fondant around your rolling pin. Lift the pin and carefully unroll the fondant over your cake. Start from the top center and let the edges drape evenly over the sides.

Smoothing and Trimming: The Final Steps

Once the fondant is draped, the real magic happens. Begin by gently smoothing the top of the cake from the center outward. This pushes any air bubbles toward the edge. If you encounter an air bubble, you can carefully prick it with a pin and smooth it out. Do not press too hard, or you will stretch the fondant, which can cause it to tear later.

Next, move to the sides. Use your fondant smoother to press the fondant gently against the buttercream, working from the top down to the bottom. This creates a sharp, clean edge at the top of the cake. Use the palm of your hand to smooth the fondant against the sides, easing out any pleats or folds. Work your way around the cake slowly.

Finally, trim the excess fondant from the bottom. Use a sharp knife or pizza cutter held at a slight angle against the base of the cake. Cut all the way around. Do not pull the excess off; let it fall away naturally. You can then use your smoother to polish the entire surface one last time, removing any lingering fingerprints or imperfections.

COMMON FONDANT PROBLEMS AND HOW TO FIX THEM

Every beginner runs into issues. The important thing is knowing how to fix them. Here are some of the most common challenges you might face when working with fondant icing for beginners.

Dealing with Cracks and Tears

Cracks usually mean the fondant is too dry. If you notice cracking as you are rolling, try kneading in a tiny bit of vegetable shortening or water. If a tear happens while you are draping, do not panic. You can often patch it by pressing a small piece of fresh fondant into the tear and smoothing it over with a little water. If the tear is in a non-critical area, it can be hidden with a decorative element later.

Preventing Elephant Skin

"Elephant skin" refers to the wrinkled, textured look that fondant can get if it sits out too long. This is caused by the surface drying faster than the underlying layer. The best prevention is to work quickly. Keep any fondant you are not using tightly wrapped. A humid environment can also help. If you see a wrinkle forming, you can sometimes gently lift the fondant and

smooth it downward, or use a steamer (carefully) to relax the surface.

Fixing Sticky Fondant

Sticky fondant is usually the result of high humidity or too much moisture in the recipe. If your fondant is sticking to your hands or the rolling pin, dust your tools lightly with cornstarch. Be careful not to overdo it, as too much cornstarch can cause the fondant to crack as it dries. If the entire batch is too sticky, you can try kneading in a little more powdered sugar.

DECORATING YOUR FONDANT CAKE

Once your cake is perfectly covered, the real fun begins. Fondant is a fantastic canvas for all kinds of decorations. You can create simple stripes, polka dots, or geometric patterns using cut-out fondant pieces. Use a little water or edible glue to attach them. You can also use stencils and dusting powders to add color and texture. For a very beginner-friendly approach, a simple ribbon around the base of the cake can hide any uneven edges and add a polished look. The more you practice, the more adventurous you can become with ruffles, bows, and even simple figures.

STORING YOUR FONDANT CREATIONS

Knowing how to store your finished cake is

just as important as making it. Fondant does not like moisture. A covered fondant cake should be stored in a cool, dry place, away from direct sunlight. Do not put it in the refrigerator unless absolutely necessary, as condensation will form on the fondant and make it sticky and dull. If you must refrigerate it (for a filling that requires it), place the cake in a very sturdy box and take it out well in advance of serving to allow the condensation to evaporate. Fondant decorations can be stored in a dry, airtight container for weeks or even months.

CONCLUSION: PRACTICE MAKES PROGRESS

Working with fondant icing for beginners is a skill that rewards patience and practice. Your first cake may not be perfect, and that is perfectly fine. Each time you knead, roll, and drape, you will develop a better feel for the material. You will learn how it behaves in different temperatures and how to troubleshoot common issues. The techniques covered in this guide provide a solid foundation. Start with simple shapes and finishes, and gradually challenge yourself with more complex designs. Before long, you will be creating beautiful, smooth, and impressive cakes that look like
